Revision History

Changes to the original guide are listed below:

Change	Data	Description
Rev10	12/2015	Initial Release
Rev11	01/2016	RS232 changes to TTL with DB50
Rev12	02/2016	Add typical circuit
Rev13	07/2016	Add setting and saving custom defaults

Contents

ABOUT THIS GUIDE

Introduction

The HT850 Decoder Integration Guide provides general instructions for mounting, setting up and programming the HT850 decoder.

Notational Conventions

The following conventions are used in this document:

- *Italics* are used to highlight the following:
 - Chapters and sections in this and related documents
 - Dialog box, window and screen names
 - Drop-down list and list box names
 - Check box and radio button names
- **Bold** text is used to highlight the following:
 - Key names on a keypad
 - Button names on a screen
- Bullets (•) indicate:
 - Action items
 - Lists of alternatives
 - Lists of required steps that are not necessarily sequential
 - Sequential lists (e.g., those that describe step-by-step procedures) appear as numbered lists.
 - Throughout the programming bar code menus, asterisks (*) are used to denote default parameter settings.

*Indicates Default → *Aim Mode On ← Feature/Option

Service Information

If you have a problem with your equipment, contact I Lab support for your region.

When contacting I Lab support, please have the following information available:

- Serial number of the DB50
- Model number or product name
- Software type and version number

I Lab responds to calls by e-mail, telephone or fax within the time limits set forth in service agreements.

If your problem cannot be solved by I Lab support, you may need to return your equipment for servicing and will be given specific directions. I Lab is not responsible for any damages incurred during shipment if the approved shipping container is not used. Shipping the units improperly can possibly void the warranty.

If you purchased your business product from an I Lab business partner, please contact that business partner for support.

CHAPTER 1 GETTING STARTED

Introduction

The HT850 is a companion decoder module, which controls the imager, acquires images, and decodes 1D and 2D symbologies.

The HT850 is a multi-chip processing system, composed of an ARM core and related subsystems. The DB50 includes a variety of USB and single RS-232 interfaces.

DB50 architecture includes:

- Atmel AT91SAM9 processor core, 400 MHz
- 32 MB LPDDRAM
- 8 MB SPI flash
- Image Sensor Interface (ISI) port
- Host communication port.

System peripherals include:

- One UART (RS-232) channel
- I2C bus used for camera control
- USB 1.1 High Speed port for image and bar code data transfers.

This integration guide describes the decoder theory of operation, installation, specifications, and configuration.

Theory of Operation

During image capture:

1. The image sensor array in the camera board captures an image of the bar code through the engine's optical lens. If necessary, the DB50 automatically adjusts illumination, exposure, and other parameters to obtain the best quality image.
2. The camera board sends the image to the HT850 decoder board.
3. The HT850 processes the image to identify the target bar code(s), decodes them, and transmits the decoded data to the host.

Set various parameters provided in this guide to adjust the performance of the camera board and DB50 to match the application or desired usage profile.

HT850 Decoder

Figure 1-1 provides a block diagram for the decoder.

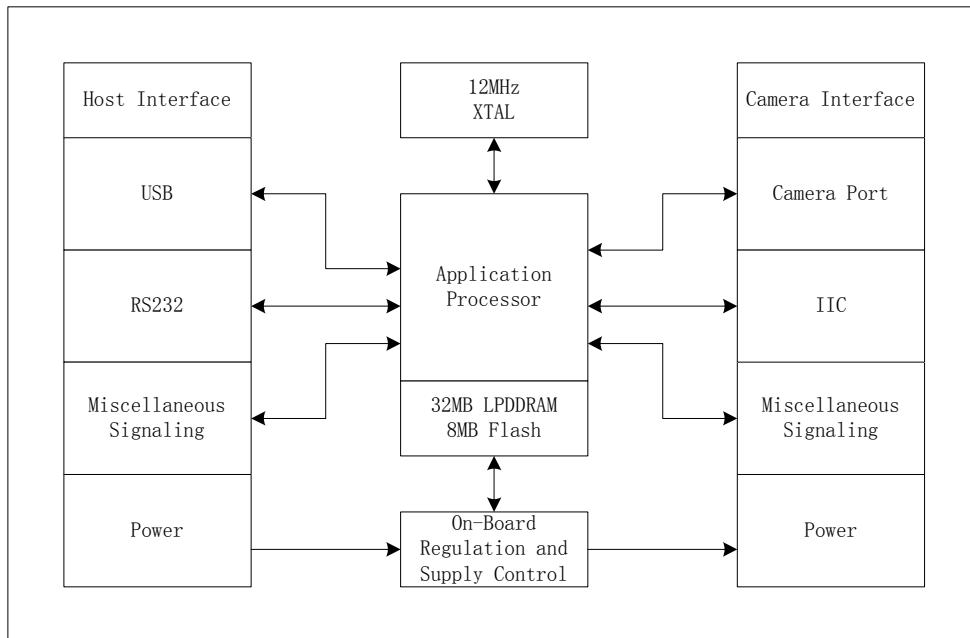

Figure 1-1 DB50 Decoder Block Diagram

Power Management

USB

The HT850 does not exceed the USB limit of 500mA when drawing power from the USB bus.

RS232

When using RS232 host interface, HT850 works in one of the following power mode:

- **Normal mode:** The HT850 is fully awake and running, even when not in a decode session.
- **Power down mode:** The HT850 can enter into power down mode.

Method of waking up the HT850:

- Set the pin nTRIGGER_UP to low.

Interfaces

The DB50's host interface can be configured by scanning specific bar code or sending serial commands.

Table 1-1 Host Interface Configuration

	Interfaces	Configuration Options
Bar Code	USB Keyboard(Default)	See section of USB Keyboard(PC)
	RS232	See section of USB Serial
	USB Serial	See section of TTL Interface
Serial Command	USB Keyboard(Default)	See section of DB50 Menu Commands
	RS232	
	USB Serial	

Indicators

The pin BEEPER_PWM and LED output lines provide user feedback but do not provide enough current for the actual beeper and led device. Additional buffering is required.

Supported Symbologies

The following symbologies are supported and can be individually enabled or disabled:

1D Symbologies

EAN-8	EAN-13
UPC-A	UPC-A with Coupon Code
UPC-E0	UPC-E1
Code 39	Code 93
Codabar	Code 128
GS1-128	Code 32
Interleaved 2 of 5	Matrix 2 of 5
Straight 2 of 5 IATA(two-bar start/stop)	Straight 2 of 5 Industrial (three-bar start/stop)
Codablock A	Codablock F
GS1 DataBar Expanded	GS1 DataBar Limited
GS1 DataBar Omnidirectional	MSI
Telepen	Code 11

2 D Symbologies

QR Code	PDF417
MicroPDF417	Data Matrix
Aztec Code	Han Xin Code

Maxicode

TCIF Linked Code 39 (TLC39)

CHAPTER 2 INSTALLATION AND SPECIFICATION

Introduction

This chapter provides information for connecting and mounting the DB50 decoder.

General Information

Grounding

The mounting holes for the HT850 include exposed copper that may, if necessary, be used to electrically ground the decoder to the host using metal screws. If installing the HT850 in a host where there is a potential to inject ground noise, use nylon or other non-conductive hardware. In this case the HT850 ground is provided through the host connector.

Electrical Isolation

Both sides of the HT850 decoder board include components and electrical conductors that must be isolated from contact with components on the host device.

Electrostatic Discharge (ESD)

The HT850 decoder is protected from ESD events that can occur in an uncontrolled environment, however, use care when handling the module and apply standard ESD precautions such as using grounding wrist straps and handling only in a properly grounded work area.

Environment

Enclose the HT850 decoder sufficiently to prevent dust from gathering on the printed circuit board and components. Dust and other contaminants can eventually degrade performance. IA does not guarantee performance of the decoder when used in an exposed application.

Power Supply Noise

For reliable operation a low-noise power supply is required. Pay close attention to power supply quality and testing to ensure the best performance from the HT850 and imager engine components.

VCC_5V: For a host that supplies 5 VDC to the decoder, the decoder maintains proper regulation and supply

quality.

Thermal Considerations

The HT850 decoder module includes several high-power components that dissipate heat during operation. These components can exhibit high temperatures when the HT850 /imager engine pair is running at 30 frames per second with full illumination. Use care when integrating the HT850 /imager engine pair into the target application.

Protective measures that reduce power consumption and/or facilitate heat removal within a target system include but are not limited to:

- Reducing illumination intensity on the camera board
- Mounting the HT850 to a solid metallic surface using metal screws
- Selecting a housing design that allows for natural or forced convection.

Note that running the HT850 /imager engine pair in continuous 30 fps with both aiming and illumination enabled full time is highly uncommon. Typical decoding and image capture applications are low duty cycle operations and internal temperature rise due to the HT850 /imager engine pair should be minimal.

HT850 Decoder Board

There are two mounting holes (1.8 mm) on the decoder board.

The following figure provides an outline drawing for the HT850 decoder board. Position the board in the host equipment so that the connecting interface cable reaches the engine.

The HT850 boards contain components and circuitry on both sides.

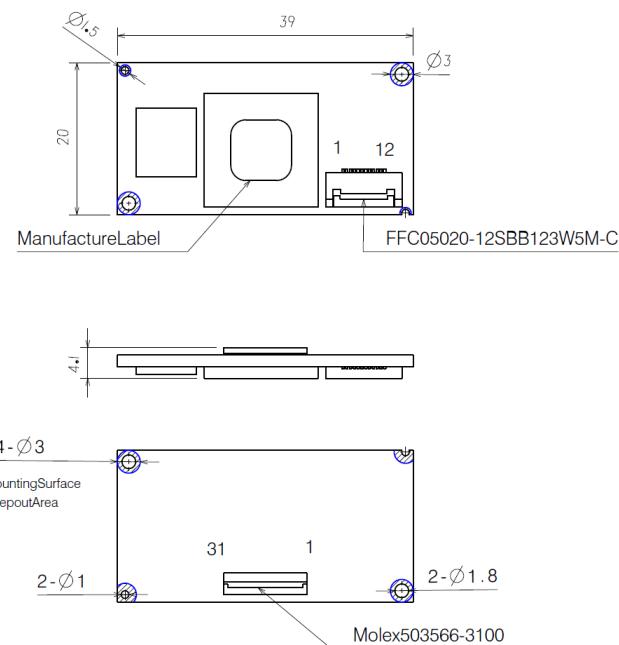

Figure 2-1 HT850 Decoder Board Drawing

Notes: Unless otherwise specified:

- This is a reference drawing and is not intended to specify or guarantee all possible integration requirements for this decoder.
- Dimensions are in mm.
- Tolerance for dimensions is ± 0.25 mm.

HT850 Electrical Information

Power Supply Requirements

The HT850 decoder board can be powered from Host 5 VDC. The HT850 uses an intelligent hardware multiplexer to configure the most efficient power supply arrangement for the combined HT850 /imager engine system

Table 2-1 HT850 Electrical Characteristics-Power

Symbol	Parameter	Condition	Minimum	Typical	Maximum	Units
VCC_5V	Supply	Voltage	4.5	5	5.5	V

DC Characteristics

Table 2-2 HT850 Electrical Characteristics-DC characteristics

Signals	Min	Nominal	Max	Unit
nRESET_IN	4.5	5	5.5	V
BEEPER_PWM	2.7	3.3	3.6	V
LED	2.7	3.3	3.6	V
nTRIG_UP	2.7	3.3	3.6	V

Electrical Interface

Table 2-3 and **Table 2-4** list the pin functions of the imager engine and HT850 interfaces, and illustrate typical input and output circuitry.

Note: Signal directions are listed relative to HT850 decoder module.

Table 2-3 Imager Engine Signal Descriptions

Signal Name	Description	Dir	Engine Interface
PWR_DN	Module enter deep sleep mode	Input	1
LDO_EN	Power on/off sensor	Input	2
VSS	Ground	Ground power	3

uTRIGGER_UP	Used to start a decode session or wake up system from power down mode.	Input	12

Technical Specifications

Table 2-5 provides the technical specifications for the HT850 decoder. Note that current draw figures are valid for a HT850 with an attached IA200 imager engine.

Table 2-5 HT850 Decoder Technical Specifications at 23°C

Item	Description
Power Requirements:	Supply currents listed below are typical values in mA, RMS, at nominal supply voltage unless otherwise specified.
Host Supply 5V:	
Supply Voltage	5 V +/- 0.5 V
Idle Current	25.6 mA
Operating Current	80.0 mA
Peak Current	190.0 mA
Maximum Power Supply Noise	100 mVp-p - bar code and image capture applications,
Start Up Time	
From Power On	TTL: 1052 ms USB : Host dependent
Baud Rate	300,600,1200,2400,4800,9600, 19200, 38400, 57600, 115200
Dimensions	39.0 mm x 20.0 mm x 4.1 mm

Typical Interface Board Circuit

Figure 2-2 shows the typical circuit for signal of LED. **Figure 2-3** shows the typical circuit for signal of BEEPER_PWM. **Figure 2-4** shows the typical circuit for signal of nRESET_IN. **Figure 2-5** shows the typical circuit for signal of uTRIG_UP.

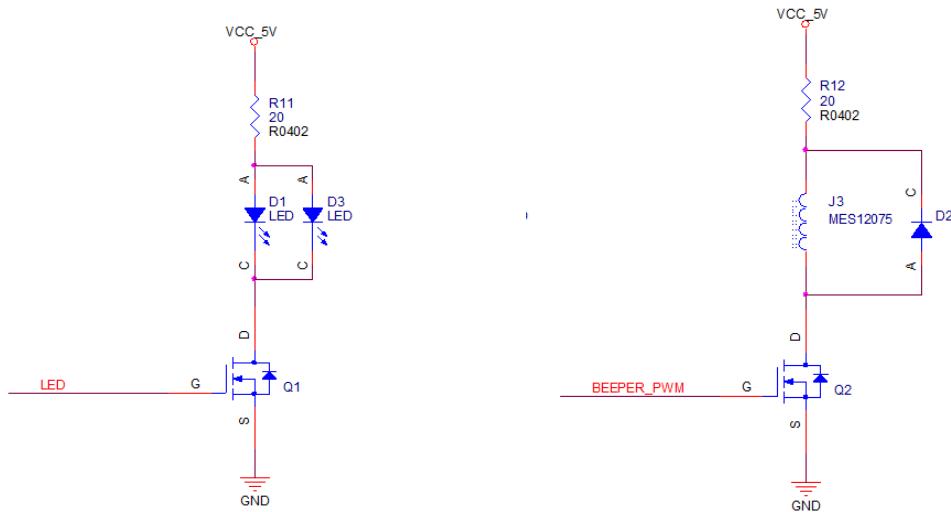

Figure 2-2 The typical circuit for signal of LED

Figure 2-3 The typical circuit for signal of BEEPER_PWM

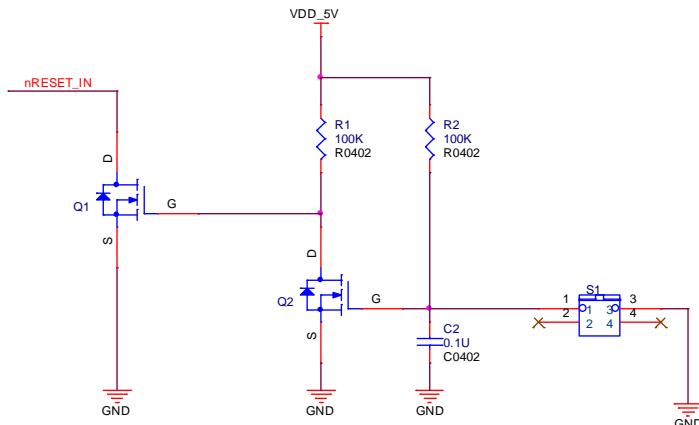

Figure 2-4 The typical circuit for signal of nRESET_IN

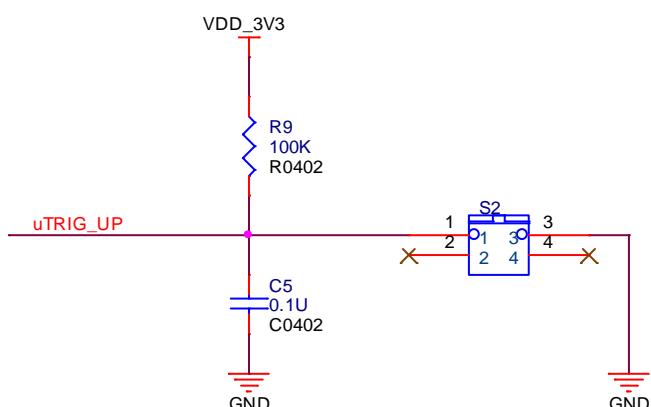

Figure 2-5 The typical circuit for signal of uTRIG_UP

CHAPTER 3 ACCESSORIES

The accessories of HT850 are listed below:

1. 12 Pin Connector for connecting HT850 to a host,
2. 31 Pin Connector for connecting HT850 to imager engine(e.g. IA200).

The drawings of the two connectors is shown by the following figures: **Figure 3-1**, **Figure 3-2**, **Figure 3-3** and **Figure 3-4**.

CHAPTER 4 USER PREFERENCES & MISCELLANEOUS OPTIONS

Introduction

This chapter describes each user preference feature and provides the programming bar codes necessary for selecting these features.

Resetting the Custom Defaults

To default all settings restored in your scanner, you can scan the **Activate Custom Defaults** bar code below.

Activate Custom Defaults

Setting Custom Defaults

You can scan **Set Custom Defaults** bar code before scanning the normal menu bar code for your custom defaults. When you have entered all the commands you want to save for your custom defaults, scan the **Save Custom Defaults** bar code, then scan **Activate Custom Defaults** bar code.

Set Custom Defaults

Save Custom Defaults

Resetting the Factory Defaults

If you want to restore the unit to factory default setting, first scan the **Remove Custom Defaults** bar code, then scan **Activate Defaults**.

Remove Custom Defaults

Activate Defaults

Suppress Power-up Beeps

To select whether or not to suppress the decoder's power-up beeps, you can scan a bar code below.

Default =Power Up Beeper On Scanner.

Power Up Beeper Off

*Power Up Beeper On

Beep on <BEL>

When this function is enabled, the decoder issues a beep when it detects a <BEL> character on the serial line. <BEL> gains a user's attention to an illegal entry or other important event.

Default=Beep On BEL Off

*Beep on BEL Off

Beep on BEL On

Trigger Click

To hear an audible click every time you press the scanner button, you can scan the **Trigger Click On** bar code below. If you don't wish to hear the click, you can scan the **Trigger Click Off** code below.

Default = Trigger Click Off.

*Trigger Click Off

Trigger Click On

NOTE: This feature has no effect on serial or automatic triggering.

Good Read and Error Indicators

Beeper – Good Read

The beeper may be programmed **On** or **Off** in response to a good read. Turning this option off, only turns off the beeper response to a good read indication. All error and menu beeps are still audible.

Default = Beeper -Good Read On.

Beeper-Good Read Off

*Beeper-Good Read On

Beeper Tone-Good Read

To select a decode beep frequency (tone), you can scan the **Low Frequency**, **Medium Frequency**, or **High Frequency** bar code below.

Default =Low Frequency (800 Hz).

*Low Frequency(800 Hz)

Medium Frequency(1600 Hz)

High Frequency(3200 Hz)

Beeper Tone-User Specified Setting

If you want to set your specified beep frequency (tone), scan the bar code below, then set the frequency (from 400-9,000 Hz) by scanning digits from the [APPENDIX B Programming Number](#), then scanning **Save**.

Beeper Tone- User Specified Setting

Beeper Volume-Good Read

To select a beeper volume, you can scan the **Low Volume**, **Medium Volume**, or **High Volume** bar code below.

Default =High Volume.

Off

Low Volume

Medium Volume

*High Volume

Beeper Duration-Good Read

To select the duration for the beeper, you can scan one of the following bar codes.

Default =Normal Beep.

* Normal Beep

Short Beep

Number of Good Decode Beeps- Good Read

The number of beeps in response to a good decode can be programmed from bar codes as below .The same number of beeps will be applied to both the beeper and LED in response to a good decode.

For example: if you select 2 beeps, there will be 2 beeps and 2 LED flashes in response to a good decode. The

beeps and LED flashes are in sync with each other.

*1 Good Read Beep/LED Flash

2 Good Read Beeps/LED Flashes

3 Good Read Beeps/LED Flashes

LED - Good Read

To select whether or not to program the LED indicator in response to a good decode, you can select a bar code below.

Default = Program LED Indicator After Good Decode.

Don't Program LED Indicator After Good Decode

*Program LED Indicator After Good Decode

Good Read Delay

This sets the minimum amount of time before the scanner can read another bar code.

Default = 0 ms (No Delay).

*No Delay

Medium Delay(1000 ms)

Long Delay(1500 ms)

Manual Trigger Mode

When in manual trigger mode, the scanner scans until a bar code is read, or until the button is released.

Default = Manual Trigger-Normal.

*Manual Trigger - Normal

LED Illumination - Manual Trigger

If you wish to set the illumination LED brightness, scan one of the barcodes below. This sets the LED illumination for the scanner when the trigger is pressed.

Default = High.

Note: The LEDs are like a flash on a camera. The lower the ambient light in the room, the brighter the LEDs need to be so the scanner can “see” the bar codes.

Low

*High

Aim Mode

It sets the aim illumination for the scanner when the trigger is pressed.

Default = Aim Mode On.

Aim Mode Off

*Aim Mode On

Presentation Mode

Presentation Mode uses ambient light to detect bar codes. When no bar code is presented to the scanner, the LED dims. When a bar code is presented to the scanner, the LED brightens to read the code.

Note: If the light level in the room is not high enough, Presentation Mode may not work properly.

Presentation Mode

Idle Illumination - Presentation Mode

Scan one of the bar codes below to set the LED illumination for the scanner when it is in an idle state in Presentation Mode.

Default = Low.

Note: If you use one of the lower Idle Illumination settings, and there is not enough ambient light, the scanner may have difficulty detecting when a bar code is presented to it. If the scanner has difficulty “waking up” to read bar codes, you may need to set the Idle Illumination to a brighter setting.

*Low

High

Presentation Sensitivity

Presentation Sensitivity is a numeric range that increases or decreases the scanner's reaction time to bar code presentation. To set the sensitivity, scan the **Sensitivity** bar code, then scan the degree of sensitivity (from 0-20) from the inside back cover, and **Save**. 0 is the most sensitive setting, and 20 is the least sensitive.

Default = 4.

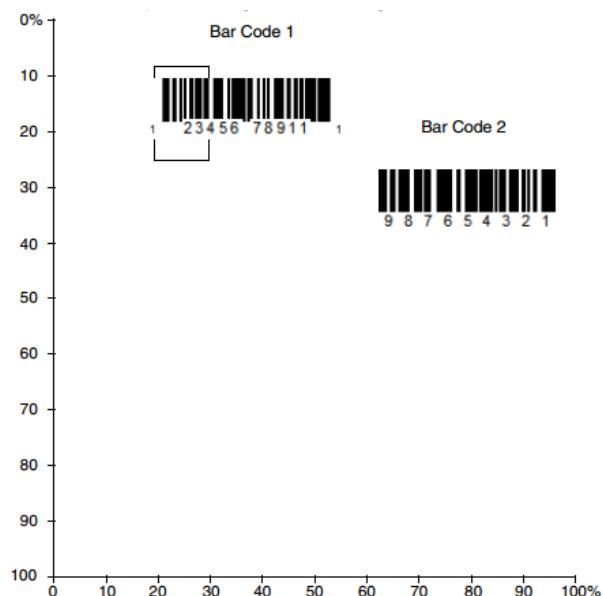

Sensitivity

Presentation Centering

Use Presentation Centering to narrow the scanner's field of view when it is in the stand to make sure the scanner reads only those bar codes intended by the user. For instance, if multiple codes are placed closely together, Presentation Centering will insure that only the desired codes are read.

Note: To adjust centering when the scanner is hand-held, see Manual Trigger Centering . If a bar code is not touched by a predefined window, it will not be decoded or output by the scanner. If Presentation Centering is turned on by scanning Presentation Centering On, the scanner only reads codes that pass through the centering window you specify using the Top of Presentation Centering Window, Bottom of Presentation Centering Window, Left, and Right of Presentation Centering Window bar codes.

In the example below, the white box is the centering window. The centering window has been set to 20% left, 30% right, 8% top, and 25% bottom. Since Bar Code 1 passes through the centering window, it will be read. Bar Code 2 does not pass through the centering window, so it will not be read.

Note: A bar code needs only to be touched by the centering window in order to be read. It does not need to pass completely through the centering window.

Scan **Presentation Centering On**, then scan one of the following bar codes to change the **top, bottom, left, or right of the centering window**. Then scan the percent you want to shift the centering window using digits on the inside back cover of this manual. Scan **Save**.

Default Presentation Centering = 40% for Top and Left, 60% for Bottom and Right.

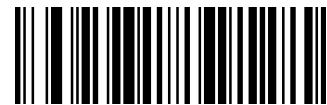

*Presentation Centering Off

Presentation Centering On

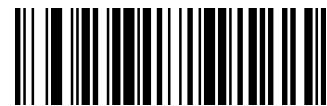

Top of Presentation Centering Window

Bottom of Presentation Centering Window

Left of Presentation Centering Window

Right of Presentation Centering Window

Mobile Phone/Display Mode

This mode improves bar code reading performance with target bar codes displayed on mobile phones and electronic displays.

Hand Held Scanning - Mobile Phone

Presentation Scanning - Mobile Phone

Note: To turn off Mobil Phone Read Mode, scan the Manual Trigger Mode bar Code.

Hands Free Time-Out

The Scan Stand and Presentation Modes are referred to as “hands free” modes. If the scanner’s button is pressed when using a hands free mode, the scanner changes to manual trigger mode. You can set the time the scanner should remain in manual trigger mode by setting the Hands Free Time-Out. Once the time-out value is reached, (if there have been no further button presses) the scanner reverts to the original hands free mode. Scan the **Hands Free Time-Out** bar code, then scan the time-out duration (from 0-300,000 milliseconds) from the inside back cover, and **Save**.

Default =5,000 ms.

Hands Free Time-Out

Reread Delay

Use this option in Presentation Mode to prevent multiple reads of a symbol left in the decoder’s field of view.

The timeout begins when you remove the symbol from the field of view.

Default = Medium(1000 ms).

No Delay

Short (500 ms)

* Medium (1000 ms)

Extra Long(2000 ms)

User-Specified Reread Delay

If you want to set your own length for the reread delay, scan the bar code below, then set the delay (from 0-30,000 milliseconds) by scanning digits from the inside back cover, then scanning **Save**.

User-Specified Reread Delay

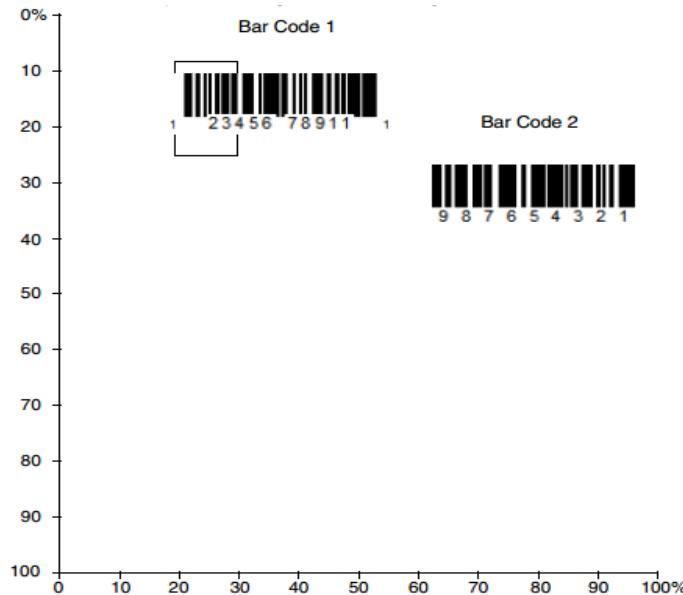

Manual Trigger Centering

Use Centering to narrow the scanner's field of view to make sure that when the scanner is hand-held, it reads only those bar codes intended by the user. For instance, if multiple codes are placed closely together, centering will insure that only the desired codes are read.

Note: To adjust centering when the scanner is in the stand, see Presentation Centering .

If a bar code is not touched by a predefined window, it will not be decoded or output by the scanner. If centering is turned on by scanning Centering On, the scanner only reads codes that pass through the centering window you specify using the **Top of Centering Window**, **Bottom of Centering Window**, **Left**, and **Right of Centering Window** bar codes.

In the example below, the white box is the centering window. The centering window has been set to 20% left, 30% right, 8% top, and 25% bottom. Since Bar Code 1 passes through the centering window, it will be read. Bar Code 2 does not pass through the centering window, so it will not be read.

Note: A bar code needs only to be touched by the centering window in order to be read. It does not need to pass completely through the centering window.

Scan **Centering On**, then scan one of the following bar codes to change the top, bottom, left, or right of the centering window. Then scan the percent you want to shift the centering window using digits on the inside back cover of this manual. Scan **Save**.

Default Centering = 40% for Top and Left, 60% for Bottom and Right.

* Manual Trigger Centering Off

Manual Trigger Centering On

Top of Manual Trigger Centering Window

Bottom of Manual Trigger Centering Window

Left of Manual Trigger Centering Window

Right of Manual Trigger Centering Window

Video Reverse

Video Reverse Off :Disable Video Reverse.

Video Reverse Only: Read only inverted bar codes.

Video Reverse and Standard Bar Codes :Read both types of codes.

Note: After scanning **Video Reverse Only**, menu bar codes cannot be read. You must scan **Video Reverse Off** or **Video Reverse and Standard Bar Codes** in order to read menu bar codes.

Note: Images downloaded from the unit are not reversed. This is a setting for decoding only.

* Video Reverse Off

Video Reverse and Standard Bar Codes

Video Reverse Only

Working Orientation

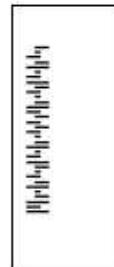

Some bar codes are direction-sensitive. For example, KIX codes and OCR can misread when scanned sideways or upside down. Use the working orientation settings if your direction-sensitive codes will not usually be presented upright to the scanner.

Default = Upright.

Upright:

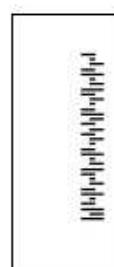

Vertical, Top to Bottom:
(Rotate CW 90°)

Upside Down:

Vertical, Bottom to Top:
(Rotate CCW 90°)

*Upright

Vertical, Bottom to Top

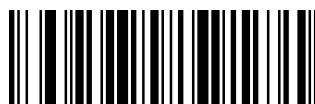

Upside Down

Vertical, Top to Bottom

Show Revision

Scan the bar code below to output the current software revision, serial number, and other product information.

Show Revision

Resetting the Factory Defaults

If you aren't sure what programming options are in your scanner, or you've changed some options and want to restore the scanner to factory default settings, first scan the **Remove Custom Defaults** bar code, then scan

Activate Custom Defaults. This resets the scanner to the factory default settings. **NOTE:** This selection erases all your settings and resets to the original factory defaults and disables all plugins.

Remove Custom Defaults

Activate Custom Defaults

CHAPTER 5 USB INTERFACE

USB Serial

Scan the following code to program the scanner to emulate a regular RS232-based COM Port. If you are using a Microsoft® Windows® PC, you will need to a driver from the IA Lab. The driver will use the next available COM Port number.

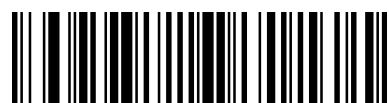

USB Serial

Note: No extra configuration (e.g., baud rate) is necessary.

ACK/NAK Mode

*ACK/NAK Mode Off

ACK/NAK Mode On

USB PC or Macintosh Keyboard

Scan one of the following codes to program the scanner for USB PC Keyboard or USB Macintosh Keyboard. Scanning these codes also adds a CR and LF.

USB Keyboard(PC)

USB Keyboard(Mac)

USB Japanese Keyboard(PC)

Keyboard Country Layout

Scan the appropriate country code below to program the keyboard layout for your country or language. As a general rule, the following characters are supported, but need special care for countries other than the United States: @ | \$ # { } [] = / ' \ < > ~

*United States

Keyboard Style

This programs keyboard styles, such as Caps Lock and Shift Lock. If you have used Keyboard Conversion settings, they will override any of the following Keyboard Style settings.

Default = Regular.

Regular is used when you normally have the Caps Lock key off.

* Regular

Caps Lock is used when you normally have the Caps Lock key on.

Caps Lock

Shift Lock is used when you normally have the Shift Lock key on (not common to U.S. keyboards).

Shift Lock

Automatic Caps Lock is used if you change the Caps Lock key on and off. The software tracks and reflects if you have Caps Lock on or off . This selection can only be used with systems that have an LED that notes the Caps Lock status .

Automatic Caps Lock

Autocaps via NumLock bar code should be scanned in countries (e.g., Germany, France) where the Caps Lock key cannot be used to toggle Caps Lock. The NumLock option works similarly to the regular Autocaps, but uses the NumLock key to retrieve the current state of the Caps Lock.

Autocaps via NumLock

Emulate External Keyboard should be scanned if you do not have an external keyboard (IBM AT or equivalent).

Emulate External Keyboard

Note: After scanning the Emulate External Keyboard bar code, you must power cycle your computer.

Keyboard Conversion

Alphabetic keyboard characters can be forced to be all upper case or all lowercase. So if you have the following bar

code: "1a2B3c4D5e," you can make the output "1A2B3C4D5E" by scanning Convert All Characters to Upper Case, or to "1a2b3c4d5e" by scanning Convert All Characters to Lower Case.

These settings override Keyboard Style selections.

Note: If your interface is a keyboard wedge, first scan the menu code for Automatic Caps Lock . Otherwise, your output may not be as expected.

Default = Keyboard Conversion Off.

* Keyboard Conversion Off

Convert All Characters to Upper Case

Convert All Characters to Lower Case

Control Character Output

This selection sends a text string instead of a control character. For example, when the control character for a carriage return is expected, the output would display [CR] instead of the ASCII code of 0D. Refer to [APPENDIX D ASCII Conversion Chart](#). Only codes 00 through 1F are converted (the first column of the chart).

Note: Control + ASCII Mode overrides this mode.

Default = Off.

* Control Character Output Off

Control Character Output On

Keyboard Modifiers

This modifies special keyboard features, such as CTRL+ ASCII codes and Turbo Mode.

Control + ASCII Mode On: The scanner sends key combinations for ASCII control characters for values 00-1F. Windows is the preferred mode. All keyboard country codes are supported.

DOS mode is a legacy mode, and it does not support all keyboard country codes. New users should use the Windows mode. Refer to [APPENDIX A Interface Keys](#) for CTRL+ ASCII Values.

Windows Mode Prefix/Suffix Off: The scanner sends key combinations for ASCII control characters for values 00-1F, but it does not translate any prefix or suffix information.

Default = Control + ASCII Mode Off.

* Control + ASCII Mode Off

DOS Mode Control + ASCII Mode On

Windows Mode Control + ASCII Mode On

Windows Mode Prefix/Suffix Off

CHAPTER 6 SERIAL INTERFACE

Introduction

This chapter describes how to set up the decoder with a serial host. The DB50 supports TTL signal. So the serial interface which converts TTL signal to RS232 signal connects the decoder to point-of-sale devices, host computers, or other devices with an available serial port (e.g., com port).

RS232 Serial Port

The **RS232 Interface** bar code is used when connecting to the serial port of a PC or terminal. The following **RS232 Interface** bar code also programs a carriage return (CR) and a line feed (LF) suffix, baud rate, and data format as indicated below. It also changes the trigger mode to manual.

RS232 Interface

Parameter	Factory Default
Serial Communication	Standard RS232
Baud Rate	115200
Parity Check	None
Data Bits	8
Stop Bits	1
Hardware Flow Control	None

Baud Rate

Baud rate is the number of bits of data transmitted per second. Set the decoder's baud rate to match the baud rate setting of the host device. Otherwise, data may not reach the host device or may reach it in distorted form.

Default=Band Rate 115200

Band Rate 300

Band Rate 600

Band Rate 1200

Band Rate 2400

Band Rate 4800

Band Rate 9600

Band Rate 19200

Band Rate 38400

Band Rate 57600

*Band Rate 115200

RS232 Receiver Time-Out

The DB50 runs normal until the RS232 Receiver Time-Out expires and the DB50 will enter in Power Down mode which the DB50 power consumption is none . A manual trigger resets the time-out and wake up the DB50. The receiver Change the RS232 receiver time-out by scanning the bar code below, then scanning digits from the inside back cover of this manual, then scanning Save. The range is 0 to 300 seconds.

Default = 0 seconds (no time-out - always on).

RS232 Receiver Time-Out

CHAPTER 7 SYMOLOGIES

Introduction

This chapter describes symbology features and provides the programming bar codes for selecting these features. If the default values suit requirements, programming is not necessary.

All Symbologies

All Symbologies Off: To disable all symbologies, scan the **All Symbologies Off** bar code. This is useful when enabling only a few code types.

All Symbologies On: To enable all symbologies, scan the **All Symbologies On** bar code.

All Symbologies Off

All Symbologies On

UPC/EAN

Default All UPC-A Settings

To default all UPC-A Settings, scan the bar code below.

Default All UPC-A Settings

Enable/Disable UPC-A

To enable or disable UPC-A, scan the appropriate bar code below.

Default =UPC-A On.

UPC-A Off

*UPC-A On

Note: When UPC-A Off is scanned, UPC-A bar codes are transmitted as EAN-13.

UPC-A Check Digit

The check digit is the last character of the symbol used to verify the integrity of the data. Scan the appropriate bar code below to transmit the bar code data with or without the UPC-A check digit. It is always verified to guarantee the integrity of the data.

Default= UPC-A check digit On.

UPC-A check digit Off

*UPC-A check digit On

UPC-A Number System

The numeric system digit of a U.P.C. symbol is normally transmitted at the beginning of the scanned data. To select whether or not to transmit the number system, you can scan one of the bar codes below.

Default = UPC-A Number System On.

UPC-A Number System Off

*UPC-A Number System On

UPC-A Addenda

This selection adds 2 or 5 digits to the end of all scanned UPC-A data.

Default = Off for both 2 Digit and 5 Digit Addenda.

* 2 Digit Addenda Off

2 Digit Addenda On

* 5 Digit Addenda Off

5 Digit Addenda On

UPC-A Addenda Required

When **UPC-A Addenda Required** bar code is scanned, the scanner only can read UPC-A bar codes that have addenda.

Default = UPC-A Addenda Not Required.

* UPC-A Addenda Not Required

UPC-A Addenda Required

UPC-A Addenda Separator

UPC-A Addenda Separator On: There is a space between the data from the bar code and the data from the addenda.

UPC-A Addenda Separator Off: There is no space between the data from the bar code and the data from the addenda.

Default = UPC-A Addenda Separator On.

UPC-A Addenda Separator Off

* UPC-A Addenda Separator On

UPC-A/EAN-13 with Extended Coupon Code

To enable or disable UPC-A and EAN-13 with Extended Coupon Code, you can scan the bar codes below.

Off: Treats Coupon Codes and Extended Coupon Codes as single bar codes.

Allow Concatenation: The scanner sees the coupon code and the extended coupon code in a single read, it transmits both as separate symbologies. Otherwise, it transmits the first coupon code it reads.

Require Concatenation: The scanner must see and read the coupon code and extended coupon code in a single read to transmit the data. No data is output unless both codes are read.

Default = Off.

* Off

Require Concatenation

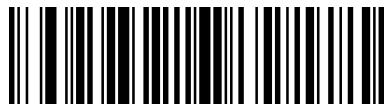

Allow Concatenation

Coupon GS1 DataBar Output

If you scan coupons that have both UPC and GS1 DataBar codes, you may wish to scan and output only the data from the GS1 DataBar code.

To scan and output only the GS1 DataBar code data, you can scan the **GS1 Output On** code below.

Default = GS1 Output Off.

*GS1 Output Off

GS1 Output On

Default All UPC-E0 Settings

Most U.P.C. bar codes lead with the 0 number system. To read these codes, use the UPC-E0 On selection.

To default all UPC-E0 Settings, scan the bar code below.

Default all UPC-E0 Settings

Enable/Disable UPC-E0

To enable or disable UPC-E, scan the appropriate bar code below.

Default =UPC-E0 On.

UPC-E0 Off

* UPC-E0 On

UPC-E0 Expand

UPC-E Expand expands the UPC-E code to the 12 digit, UPC-A format.

Default = UPC-E0 Expand Off.

*UPC-E0 Expand Off

UPC-E0 Expand On

UPC-E0 Number System

The numeric system digit of a U.P.C. symbol is normally transmitted at the beginning of the scanned data. To select whether or not to transmit the number system, you can scan one of the bar codes below.

Default = UPC-E0 Number System On.

UPC-E0 Number System Off

*UPC-E0 Number System On

UPC-E0 Addenda

This selection adds 2 or 5 digits to the end of all scanned UPC-E data.

Default = Off for both 2 Digit and 5 Digit Addenda.

* 2 Digit Addenda Off

2 Digit Addenda On

* 5 Digit Addenda Off

5 Digit Addenda On

UPC-E0 Addenda Required

When **UPC-E0 Addenda Required** bar code is scanned, the scanner only can read UPC-E0 bar codes that have addenda.

Default =UPC-E0 Addenda Not Required.

* UPC-E0 Addenda Not Required

UPC-E0 Addenda Required

UPC-E0 Addenda Separator

UPC-E0 Addenda Separator On: There is a space between the data from the bar code and the data from the addenda.

UPC-E0 Addenda Separator Off: There is no space between the data from the bar code and the data from the addenda.

Default =UPC-E0 Addenda Separator On.

UPC-E0 Addenda Separator Off

*UPC-E0 Addenda Separator On

Transmit UPC-E0 Check Digit

The check digit is the last character of the symbol used to verify the integrity of the data. Scan the appropriate bar code below to transmit the bar code data with or without the UPC-E0 check digit. It is always verified to guarantee the integrity of the data.

Default= UPC-E0 Check Digit On.

UPC-E0 Check Digit Off

*UPC-E0 Check Digit On

Enable/Disable UPC-E1

To enable or disable UPC-E1, scan the appropriate bar code below. *Default= UPC-E1 Off.*

NOTE: UPC-E1 is not a UCC (Uniform Code Council) approved symbology.

* UPC-E1 Off

UPC-E1 On

Default All EAN/JAN-8 Settings

To default all EAN/JAN-8 Settings, scan the bar code below.

Default =Code 128 On.

Code 128 Off

*Code 128 On

ISBT 128 Concatenation

ISBT Concatenation Off: The decoder does not concatenate pairs of ISBT codes it encounters.

ISBT Concatenation On: There must be two ISBT codes in order for the decoder to decode and perform concatenation. The decoder does not decode single ISBT symbols.

The use of ISBT formats requires a paid license. The ISBT 128 Application Specification describes 1) the critical data elements for labeling blood products, 2) the current recommendation to use Code 128 due to its high degree of security and its space-efficient design, 3) a variation of Code 128 that supports concatenation of neighboring symbols, and 4) the standard layout for bar codes on a blood product label. Use the bar codes below to turn concatenation on or off.

Default =ISBT 128 Off.

* ISBT 128 Off

ISBT 128 On

Code 128 Message Length

Data Matrix

Default All Data Matrix Settings

To default all Data Matrix Settings, scan the bar code below.

Default All Data Matrix Settings

Enable/Disable Data Matrix

To enable or disable Data Matrix, scan the appropriate bar code below.

Default =Data Matrix On.

Data Matrix Off

*Data Matrix On

Data Matrix Message Length

To change the message length of Data Matrix, you can scan the bar codes below. Minimum and Maximum lengths = 1-3116.

Minimum Default = 1, Maximum Default = 3116.

Minimum Message Length

Maximum Message Length

Maxicode

Default All MaxiCode Settings

To default all Maxicode Settings, scan the bar code below.

Default all Maxicode Settings

Enable/Disable MaxiCode

To enable or disable Maxicode, scan the appropriate bar code below.

Default =MaxiCode Off.

* Maxicode Off

Maxicode On

Maxicode Message Length

To change the message length of Maxicode, you can scan the bar codes below. Minimum and Maximum lengths = 1-150.

Minimum Default = 1, Maximum Default = 150.

Minimum Message Length

Maximum Message Length

QR Code

Default All QR Code Settings

To default all QR Code Settings, scan the bar code below.

Default all QR Code Settings

Enable/Disable QR Code

To enable or disable QR Code, scan the appropriate bar code below.

Notes: This selection below applies to both QR Code and Micro QR Code.

Default =QR Code On.

QR Code Off

*QR Code On

QR Code Message Length

To change the message length of QR Code, you can scan the bar codes below. Minimum and Maximum lengths = 1-7089.

Minimum Default = 1, Maximum Default = 7089.

Minimum Message Length

Maximum Message Length

Aztec Code

Default All Aztec Settings

To default all Aztec Settings, scan the bar code below.

Default All Aztec Settings

Enable/Disable Aztec

To enable or disable Aztec, scan the appropriate bar code below.

Default =Aztec On.

Aztec Off

*Aztec On

Aztec Code Message Length

To change the message length of Aztec Code, you can scan the bar codes below. Minimum and Maximum lengths = 1-3832.

Minimum Default = 1, Maximum Default = 3832.

Minimum Message Length

Maximum Message Length

Aztec Append

This function allows the scanner to append the data from several Aztec bar codes together before transmitting

them to the host computer. When the scanner encounters an Aztec bar code with the append trigger character(s), it buffers the number of Aztec bar codes determined by information encoded in those bar codes. Once the proper number of codes is reached, the data is output in the order specified in the bar codes.

Default =Aztec Append Off.

*Aztec Append Off

Aztec Append On

Aztec Code Page

Aztec Code pages define the mapping of character codes to characters. If the data received does not display with the proper characters, it may be because the bar code being scanned was created using a code page that is different from the one the host program is expecting. If this is the case, scan the bar code below, select the code page with which the bar codes were created, and scan the value and the **Save** bar code from the [APPENDIX B Programming Number](#). The data characters should then appear properly.

Aztec Code Page

Chinese Sensible (Han Xin) Code

Default All Chinese Sensible (Han Xin) Code Settings

To default all Chinese Sensible (Han Xin) Code Settings, scan the bar code below.

Default all Chinese Sensible (Han Xin) Code Settings

Enable/Disable Chinese Sensible (Han Xin) Code

To enable or disable Chinese Sensible (Han Xin) Code, scan the appropriate bar code below.

Default =Chinese Sensible (Han Xin) Code Off.

*Chinese Sensible (Han Xin) Code Off

Chinese Sensible (Han Xin) Code On

Han Xin Code Message Length

To change the message length of Han Xin Code, you can scan the bar codes below. Minimum and Maximum lengths = 1-7833.

Minimum Default = 1, Maximum Default = 7833.

Minimum Message Length

Maximum Message Length

Postal Codes – Linear

The following lists linear postal codes. Any combination of linear postal code selections can be active at a time.

China Post (Hong Kong 2 of 5)

Default All China Post Settings

To default all China Post Settings, scan the bar code below.

Default All China Post Settings

Enable/Disable China Post

To enable or disable China Post, scan the appropriate bar code below.

Default =China Post Off.

*China Post Off

China Post On

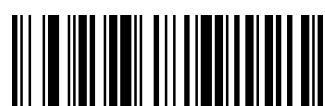

China Post (Hong Kong 2 of 5) Message Length

To change the message length of China Post (Hong Kong 2 of 5), you can scan the bar codes below. Minimum and Maximum lengths = 2-80.

Minimum Default = 4, Maximum Default = 80.

Minimum Message Length

Maximum Message Length

Korea Post

Default All Korea Post Settings

To default all Korea Post Settings, scan the bar code below.

Default All Korea Post Settings

Enable/Disable Korea Post

To enable or disable Korea Post, scan the appropriate bar code below.

Default =Korea Post Off.

*Korea Post Off

Korea Post On

Korea Post Message Length

To change the message length of Korea Post, you can scan the bar codes below. Minimum and Maximum lengths = 2-80.

Minimum Default = 4, Maximum Default = 48.

Minimum Message Length

Maximum Message Length

Korea Post Check Digit

The check digit is the last character of the symbol used to verify the integrity of the data. Scan the appropriate bar code below to transmit the bar code data with or without the Korea Post check digit. It is always verified to guarantee the integrity of the data.

Default = Don't Transmit Check Digit.

* Don't Transmit Check Digit

Transmit Check Digit

Postal Codes - 2D

The following lists the possible 2D postal codes, and 2D postal code combinations that are allowed. Only one 2D postal code selection can be active at a time. If you scan a second 2D postal code selection, the first selection is overwritten.

Default = 2D Postal Codes Off.

* 2D Postal Codes Off

Single 2D Postal Codes

Australian Post On

Planet Code Check Digit

The check digit is the last character of the symbol used to verify the integrity of the data. Scan the appropriate bar code below to transmit the bar code data with or without the Planet Code check digit. It is always verified to guarantee the integrity of the data.

Default = Don't Transmit Check Digit .

* Don't Transmit Check Digit

Transmit Check Digit

Postnet Check Digit

The check digit is the last character of the symbol used to verify the integrity of the data. Scan the appropriate bar code below to transmit the bar code data with or without the Postnet check digit. It is always verified to guarantee the integrity of the data.

Default = Don't Transmit Check Digit.

* Don't Transmit Check Digit

Transmit Check Digit

Australian Post Interpretation

This option controls what interpretation is applied to customer fields in Australian 4-State symbols.

Bar Output: It lists the bar patterns in “0123” format.

Numeric N Table: It causes that field to be interpreted as numeric data using the N Table.

Alphanumeric C Table: It causes the field to be interpreted as alphanumeric data using the C Table. Refer to the Australian Post Specification Tables.

Combination C and N Tables: It causes the field to be interpreted using either the C or N Tables.

Default =Bar Output.

* Bar Output

Numeric N Table

Alphanumeric C Table

Combination C and N Tables

CHAPTER 8 PREFIX AND SUFFIX

When a bar code is scanned, additional information is sent to the host computer along with the bar code data. This group of bar code data and additional, user-defined data is called a “message string.” The selections in this section are used to build the user-defined data into the message string. Prefix and Suffix characters are data characters that can be sent before and after scanned data. You can specify if they should be sent with all symbologies, or only with specific symbologies. The following illustration shows the breakdown of a message string:

Prefix	Scanned Data	Suffix
--------	--------------	--------

- The selections in this chapter are only used if you wish to alter the default settings.

Default prefix = None. Default suffix = None.

- A prefix or suffix may be added or cleared from one symbology or all symbologies.
- You can add any prefix or suffix from the [APPENDIX D ASCII Conversion Chart](#).
- You can string together several entries for several symbologies at one time.
- Enter prefixes and suffixes in the order in which you want them to appear on the output.
- When setting up for specific symbologies (as opposed to all symbologies), the specific symbology ID value counts as an added prefix or suffix character.
- The maximum size of a prefix or suffix configuration is 200 characters, which includes header information.

Add a Prefix or Suffix:

1. Scan the **Add Prefix** or **Add Suffix** symbol .
2. Determine the 2 digit Hex value from the Symbology Chart (included in the [APPENDIX C Symbology Charts - AIM ID](#)) for the symbology to which you want to apply the prefix or suffix. For example, for Code 128, Hex ID is “6A”.
3. Scan the 2 hex digits from the [APPENDIX B Programming Number](#) inside the back cover of this manual or scan **9, 9** for all symbologies.
4. Determine the hex value from the [APPENDIX D ASCII Conversion Chart](#), for the prefix or suffix you wish to enter.
5. Scan the 2 digit hex value from the [APPENDIX B Programming Number](#) inside the back cover of this manual.
6. Repeat Steps 4 and 5 for every prefix or suffix character.
7. To add AIM I.D., scan **5, C, 8, 1**.

To add a backslash (\), scan **5, C, 5, C**.

Note: To add a backslash (\) as in Step 7, you must scan 5C twice – once to create the leading backslash

and then to create the backslash itself.

8. Scan **Save** to exit and save, or scan **Discard** to exit without saving. Repeat Steps 1-6 to add a prefix or suffix for another symbology.

Example: Add a Suffix to a specific symbology

To send a CR (carriage return) Suffix for U.P.C. only:

1. Scan **Add Suffix**.
2. Determine the 2 digit hex value from the Symbology Chart (included in the [APPENDIX C Symbology Charts - AIM ID](#)) for U.P.C..
3. Scan **6, 3** from the [APPENDIX B Programming Number](#) inside the back cover of this manual.
4. Determine the hex value from the [APPENDIX D ASCII Conversion Chart](#), for the CR (carriage return).
5. Scan **0, D** from the [APPENDIX B Programming Number](#) inside the back cover of this manual.
6. Scan **Save**, or scan **Discard** to exit without saving.

Clear One or All Prefixes or Suffixes

You can clear a single prefix or suffix, or clear all prefixes/suffixes for a symbology. If you have been entering prefixes and suffixes for single symbologies, you can use **Clear One Prefix (Suffix)** to delete a specific character from a symbology. When you **Clear All Prefixes (Suffixes)**, all the prefixes or suffixes for a symbology are deleted.

1. Scan the **Clear One Prefix** or **Clear One Suffix** symbol.
2. Determine the 2 digit Hex value from the Symbology Chart (included in the [APPENDIX C Symbology Charts - AIM ID](#)) for the symbology from which you want to clear the prefix or suffix.
3. Scan the 2 digit hex value from the [APPENDIX B Programming Number](#) inside the back cover of this manual or scan **9, 9** for all symbologies. Your change is automatically saved.

Add a Carriage Return Suffix to All Symbologies

Scan the following bar code if you wish to add a carriage return suffix to all symbologies at once. This action first clears all current suffixes, then programs a carriage return suffix for all symbologies.

Add CR Suffix All Symbologies

Prefix Selections

Add Prefix

Clear One Prefix

Clear All Prefixes

Suffix Selections

Add Suffix

Clear One Suffix

Clear All Suffixes

Function Code Transmit

When this selection is enabled and function codes are contained within the scanned data, the scanner transmits the function code to the terminal. Charts of these function codes are provided in Supported Interface Keys starting on [APPENDIX A Interface Keys](#). When the scanner is in keyboard wedge mode, the scan code is converted to a key code before it is transmitted.

Default = Enable.

*Enable Function Code Transmit

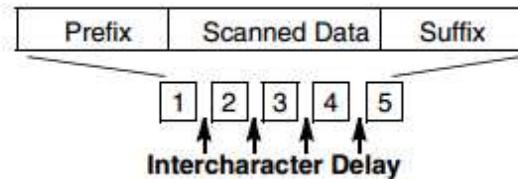

Disable Function Code Transmit

Intercharacter, Interfunction, and Intermassage Delays

Some terminals drop information (characters) if data comes through too quickly. Intercharacter, interfunction, and intermessage delays slow the transmission of data, increasing data integrity.

Intercharacter Delay

An intercharacter delay of up to 5000 milliseconds (in 5ms increments) may be placed between the transmission of each character of scanned data. Scan the **Intercharacter Delay** bar code below, then scan the number of 5ms delays, and the **Save** bar code using the [APPENDIX B Programming Number](#) inside the back cover of this manual.

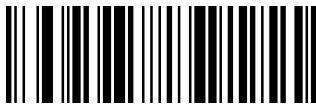

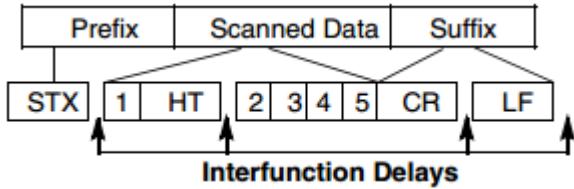

Intercharacter Delay

To remove this delay, scan the **Intercharacter Delay** bar code, then set the number of delays to 0. Scan the **Save** bar code using the [APPENDIX B Programming Number](#) inside the back cover of this manual.

Note: Intercharacter delays are not supported in USB serial emulation.

Interfunction Delay

An interfunction delay of up to 5000 milliseconds (in 5ms increments) may be placed between the transmission of each segment of the message string. Scan the Interfunction Delay bar code below, then scan the number of 5ms delays, and the Save bar code using the Programming Chart inside the back cover of this manual.

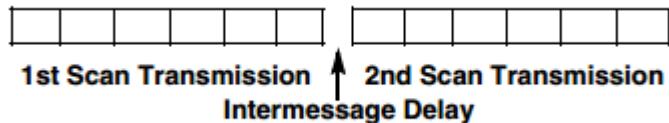

Interfunction Delay

To remove this delay, scan the **Interfunction Delay** bar code, then set the number of delays to 0. Scan the **Save** bar code using the [APPENDIX B Programming Number](#) inside the back cover of this manual.

Intermessage Delay

An intermessage delay of up to 5000 milliseconds (in 5ms increments) may be placed between each scan transmission. Scan the Intermessage Delay bar code below, then scan the number of 5ms delays, and the Save bar code using the [APPENDIX B Programming Number](#) inside the back cover of this manual.

Intermessage Delay

To remove this delay, scan the **Intermessage Delay** bar code, then set the number of delays to 0. Scan the **Save** bar code using the [APPENDIX B Programming Number](#) inside the back cover of this manual.

CHAPTER 9 SERIAL PROGRAMMING COMMANDS

The serial programming commands can be used in place of the programming bar codes. Both the serial commands and the programming bar codes will program the scanner. For complete descriptions and examples of each serial programming command, refer to the corresponding programming bar code in this manual.

The device must be set to an RS232 interface . The following commands can be sent via a PC COM port using terminal emulation software.

Function Commands

The serial function commands have the following formation:

STX + CMD(see table 11-1) + EXT

Table 9-1 Function Commands

Function	Command	Formation
Beeper Bell	\x07	\x02\x07\x03
Trigger	T	\x02T\x03
Untrigger	U	\x02U\x03

Menu Commands

The menu commands have the following syntax:

Header + Group + Item + .

Header consists of three characters. The details refer to **Table 9-2** .

Table 9-2 Header

	Command	Function
First Character(Menu type)	M	Normal type menu
Second Character(Storage type)	R	Store in RAM
	N	Store in ROM
	C	Store in customer setting place
Third Character(Action)	S	Setting
	Q	Query the current setting

	R	Return the valid setting range
--	---	--------------------------------

Note: As the default action is setting and default storage is in ROM, the 'MNS' can be simplified to be 'M'.

The serial menu commands which sets the DB50 have the following formation:

STX + @ + MENU(see table 11-2) + EXT

For example:

- Set the DB50 default: \x02@M0401.\x03
- Query the current interface: \x02@MRQ0201.\x03
- Query the range value of reread delay : \x02@MRR1102.\x03

Resetting the Custom Defaults

If you want the custom default settings restored to your scanner, scan the **Activate Custom Defaults** bar code below. This resets the scanner to the custom default settings. If there are no custom defaults, it will reset the scanner to the factory default settings. Any settings that have not been specified through the custom defaults will be defaulted to the factory default settings.

Activate Custom Defaults

The charts on the following pages list the factory default settings for each of the commands (indicated by an asterisk (*) on the programming pages).

APPENDIX D ASCII Conversion Chart

In keyboard applications, ASCII Control Characters can be represented in 3 different ways, as shown below. The CTRL+X function is OS and application dependent. The following table lists some commonly used Microsoft functionality. This table applies to U.S. style keyboards. Certain characters may differ depending on your Country Code/PC regional settings.

Non-printable ASCII control characters			Keyboard Control + ASCII (CTRL+X) Mode		
			Control + X Mode Off	Windows Mode Control + X	
DEC	HEX	Char		Mode On	CTRL + X
0	00	NUL	Reserved	CTRL+ @	
1	01	SOH	NP Enter	CTRL+ A	Select all
